WEB DEVELOPMENT

ACTIVITY-BASED LEARNING (ABL) REPORT

NAME	N. Bhavya Sri	BRANCH	CSE
SECTION	2	ROLL NUMBER	26000110

A practical report on websites developed using HTML and CSS

1. Introduction

This Activity-Based Learning (ABL) assignment describes websites created as part of web development practice. The websites focus on different everyday needs, including exploring Indian culture and heritage, ordering food online, and booking bus and train tickets. HTML is used to organize webpage content, while CSS improves the layout, colours, spacing, typography, and overall appearance.

Objectives:

- Learn how HTML elements create the structure of a webpage.
- Use CSS to style navigation bars, buttons, cards, backgrounds, and text.
- Arrange information clearly so users can understand and navigate each website.
- Practice responsive design principles so content can fit different screen sizes.

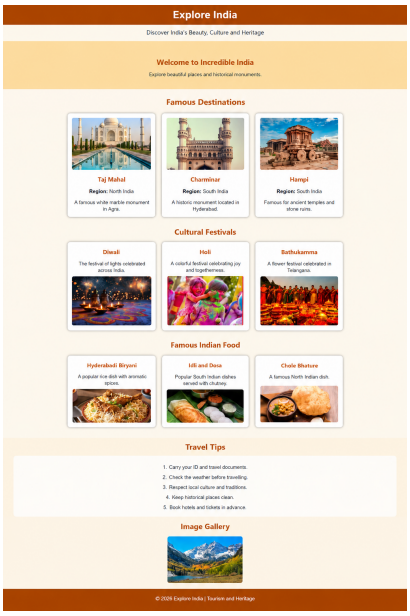

2. Case Study 1: Explore India – Culture and Heritage Website

Case number: 1

Explanation: The Explore India website introduces visitors to famous destinations, cultural festivals, traditional food, and travel tips. It uses a welcoming colour scheme and organized content sections to make information easy to read and explore.

1. Explore India – Culture and Heritage Website

The first screenshot shows a tourism website called “Explore India.” Its main purpose is to introduce visitors to India's famous places, cultural celebrations, traditional food, and basic travel advice. The warm orange and cream colours create a welcoming visual style that suits a travel and heritage theme.

Detailed section-by-section explanation

Header and tagline

At the top of the page, the title “Explore India” is displayed prominently. The subtitle, “Discover India's Beauty, Culture and Heritage,” explains the website's focus immediately. A clear heading and short tagline help users understand the site's purpose without needing to explore the page first.

Welcome section

The welcome banner introduces the idea of exploring India and invites visitors to learn about beautiful places and historical monuments. The highlighted background separates this introduction from the information below, making the page easier to scan.

Famous destinations

Three destination cards feature the Taj Mahal, Charminar, and Hampi. Each card includes a photograph, a destination name, its region, and a short description. The Taj Mahal is presented as a white-marble monument in Agra in North India. Charminar is described as a historic monument in Hyderabad, and Hampi is associated with ancient temples and stone ruins in South India. The repeated card layout lets users compare destinations quickly.

Cultural festivals

The festival section highlights Diwali, Holi, and Bathukamma. Diwali is described as the festival of lights, Holi as a colourful celebration of joy and togetherness, and Bathukamma as a flower festival celebrated in Telangana. Pictures make these cultural events easier to recognize and help communicate the variety of India's traditions.

Famous Indian food

This section presents Hyderabad Biryani, Idli and Dosa, and Chole Bhature. Short descriptions introduce the dishes and their regional or culinary associations. Food content adds another reason for visitors to explore India and makes the site useful to people interested in local cuisine as well as sightseeing.

Travel tips

A numbered list gives practical reminders: carry identification and travel documents, check the weather, respect local culture and traditions, keep historical places clean, and book hotels and tickets in advance. These tips are brief, easy to read, and relevant to planning a trip.

Image gallery and footer

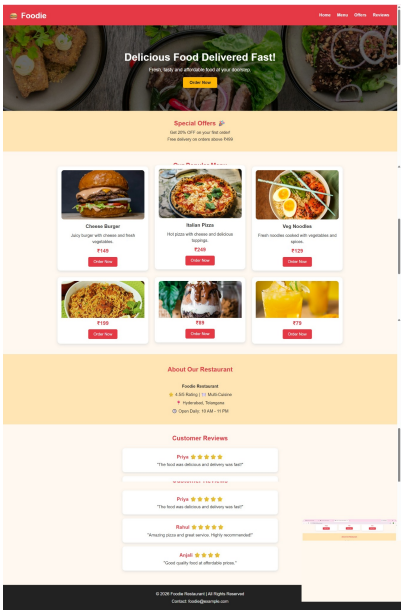

The image gallery provides a final travel photograph, giving the page a visual ending. The footer displays the year and the site's tourism-and-heritage theme. In a fuller version of the website, the gallery could include more photographs and links to detailed destination pages.

Overall purpose: to act as a simple introduction to Indian tourism, heritage, festivals, and food. It is most useful as an informational or educational website for people beginning to plan a visit or learn about India.

Suggested improvements: Possible improvements: add navigation links to each section, provide maps and opening hours for monuments, include travel routes and accessibility details, add more gallery images, and make sure image descriptions and text remain readable on mobile screens.

2. Foodie – Restaurant and Food Delivery Website

The second screenshot shows a restaurant and food-delivery website called “Foodie.” It is designed to present menu items and offers, encourage visitors to place an order, and provide restaurant details and customer feedback. Its red header and buttons make the main actions stand out, while the food photographs help customers judge the dishes visually.

Detailed section-by-section explanation

Navigation bar

The top bar contains the Foodie brand and navigation options such as Home, Menu, Offers, and Reviews. These labels divide the site into familiar sections and help visitors find the information they want. A useful next step for a working website would be to connect each item to the correct section or page.

Main banner

The large hero area displays the message “Delicious Food Delivered Fast!” and a short line about fresh, tasty, affordable food. The “Order Now” button is the main call to action: it directs attention toward placing an order rather than simply reading the page. The background food imagery supports the restaurant theme.

Special offers

The offers section promotes a discount for a first order and free delivery above a stated order value. These promotions can encourage new customers to try the service and can increase the size of an order. In a live site, offer conditions and expiry dates should be stated clearly.

Popular menu cards

The menu area uses cards to present dishes such as a cheese burger, Italian pizza, and vegetable noodles, along with other food and drink options. Cards typically combine an image, item name, short description, price, and an “Order Now” button. This format helps users scan options and compare prices. Some cards in the screenshot show less text than others, so consistent descriptions and item names would make the menu clearer.

Pricing and ordering

Prices are displayed in Indian rupees, making the cost visible before a customer proceeds. Buttons suggest that a customer can start an order from a specific item. To support real transactions, the website would also need item customisation where appropriate, a cart, quantity controls, delivery address details, payment options, and an order confirmation.

Restaurant information

The “About Our Restaurant” section gives a restaurant name, rating, cuisine information, location in Hyderabad, Telangana, and daily opening hours. This helps customers decide whether the restaurant is suitable and when they can order. A production version could add a phone number, map, delivery area, and allergen information.

Customer reviews

The review cards show customer names, star ratings, and short comments about food quality, speed, service, and value. Reviews can build trust by giving visitors an idea of other customers' experiences. Reviews should be genuine, readable, and easy to distinguish from promotional content.

Footer

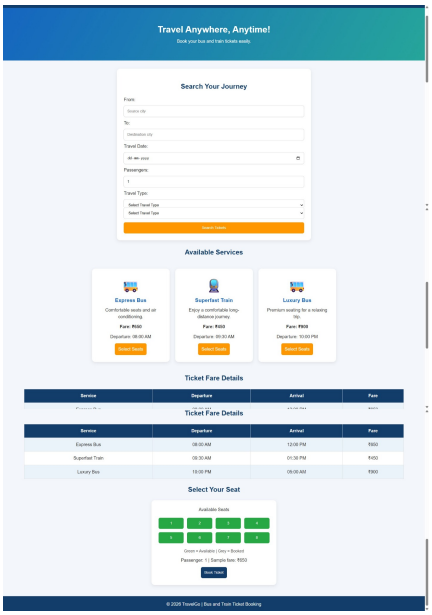

The dark footer contains copyright information and a contact email. A footer is a common place for contact information, policies, and links such as privacy, refunds, delivery terms, and customer support. The screenshot also appears to contain repeated or overlapping review content and uneven layout spacing, which could be corrected to make the page look more polished.

Overall purpose: to promote a restaurant, display its menu and prices, advertise offers, and guide customers toward ordering food online.

Suggested improvements: Possible improvements: make all menu cards consistent, fix repeated or overlapping sections, ensure every button works, add a shopping cart and checkout flow, explain delivery charges and offer conditions, and improve responsive layout for mobile devices.

3. TravelGo – Bus and Train Ticket Booking Website

The third screenshot shows a travel booking interface called “TravelGo.” It focuses on helping users search for a journey, compare available bus and train services, review fares and timings, select a seat, and book a ticket. The blue and teal banner and pale background create a calm, travel-oriented appearance.

Detailed section-by-section explanation

Header and introduction

The top banner says “Travel Anywhere, Anytime!” and explains that users can book bus and train tickets. This heading communicates the website's main function quickly. A clear introduction is especially helpful for first-time users who need to understand what the form is for.

Journey search form

The search panel asks for a source city, destination city, travel date, number of passengers, and travel type. These fields collect the basic information needed to find suitable services. A working form should validate that the source and destination differ, the travel date is valid, passenger count is reasonable, and a travel type has been selected before searching.

Available services

Three service cards show transport choices: Express Bus, Superfast Train, and Luxury Bus. Each card includes a small icon, a brief description, a fare, a departure time, and a “Select Seats” button. The cards make it easy to compare service types at a glance, although actual availability would need to be retrieved from a live booking system.

Ticket fare details

The fare table compares service name, departure time, arrival time, and price. Tables are useful when several services share the same attributes because users can compare values row by row. The screenshot appears to show a repeated fare table or overlapping section, so the layout could be simplified to display one clear table.

Seat selection

The seat-selection panel displays numbered seats in green and explains that green means available while grey means booked. A passenger can select an available seat and then use the “Book Ticket” button. In a real booking system, seat status must update reliably so two customers cannot reserve the same seat, and the chosen seat should be held temporarily during checkout.

Booking and payment flow

The screenshot shows a booking action but does not show a complete payment or confirmation process. A full service would normally confirm passenger details, show the final fare including any fees, collect payment securely, and provide a booking reference or e-ticket. Cancellation and refund rules should also be accessible before purchase.

Footer

The footer displays the TravelGo name and the bus-and-train ticket-booking purpose. This reinforces the website identity. Useful additional footer links could include customer support, booking history, cancellation policy, terms, and privacy information.

Overall purpose: to provide a single interface for searching journeys, comparing transport services and fares, choosing seats, and starting the ticket-booking process.

Suggested improvements: Possible improvements: remove duplicated fare-table content, show the selected travel type clearly, validate form fields, provide live availability and updated fares, display journey duration and stops, and add secure payment, e-ticket, cancellation, and support features.
